REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949

Amounts in Table 3 are from non-recording gage, unless otherwise indicated

Data in Tables 3, 5, 6 and snowfall in Table 7 when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more

No record in Tables 3, 5, 7 and the Station Index No record in Tables 2 and 5 is indicated by no entry.

* And also on a later date or dates.

\+ Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield

AR This entry in time of observation column in Station Index means after rain

B Adjusted to a full month.

C In the 'Refer to Tables' column in the Station Index the letter 'C' indicates recorder stations These stations are processed for special purposes and are published later in Hourly Precipitation Data

E Water equivalent of snowfall wholly or partly estimated using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing see Table 5 for detailed daily record. Degree days, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage

S Storage precipitation station Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month

VAR This entry in time of observation column in Station Index means variable

Subscription Price 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C

CORRECTIONS WILL BE FOUND ON PAGE 139.

JULY 1953
Volume LVII No. 7

CHATTANOOGA: 1953

CALIFORNIA - JULY 1953

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 319 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 77° or 1.3° above the weighted mean. The unweighted average temperature based on the same 319 stations was 74.3° or 1.0° above the unweighted mean. The highest temperature for the State, 123°, occurred in Death Valley at Cow Creek on the 23rd and at Greenland Ranch on the 22nd and 23rd. Boca at an elevation of 5535 feet in Nevada County reported the lowest temperature for the State, 27°, on the 1st.

The average precipitation for the State based on 323 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.06 inch or 0.04 inch below the weighted mean. The unweighted average precipitation based on the same 323 stations was 0.05 inch or 0.03 inch below the unweighted mean. Based on 533 stations listed in Table 3, the average precipitation was 0.03 inch or 0.05 inch below the unweighted mean. Needles CAA Airport, in San Bernardino County, reported the greatest monthly total precipitation, 1.40 inches. Soda Springs in Nevada County recorded the greatest daily precipitation, 1.30 inches, on the 18th. Three hundred eighty-five stations scattered throughout the State reported no precipitation, while 63 stations reported only a trace.

Due to the lack of precipitation during most of June and the month of July, soils in the north coastal area became quite dry, and fire hazards in forests and ranges increased. Irrigation was necessary for all growing crops.

High temperatures on some days during the first decade in the central coastal area were favorable for rapid ripening of fruits and berries but unfavorable, in some instances, for apricots, walnuts, and lettuce. Some sunscalding and sunburn of apricots was reported in Monterey County. A prolonged warm spell without fog contributed to some small sizes in Gravenstein apples in Sonoma County. High temperatures also resulted in some dropping of blossoms on string beans in Sonoma County. Cooler weather during the latter portion of the month was favorable for crops and harvesting operations.

Warm weather in the upper Sacramento Valley together with the lack of precipitation was beneficial for most crops and farming operations. Conditions were ideal for hay and grain harvesting as well as peach picking. Considerable irrigation was necessary, however, due to above-normal temperatures and the lack of precipitation.

Above-normal temperatures and low relative humidities in the lower Sacramento Valley favored all backward crops which were retarded by the late spring cold and wet spell. Rice was particularly benefited, and tomatoes gained considerably. Sugar beets progressed satisfactorily, and control measures for mildew were more effective. Hot, dry weather was very favorable for harvesting of small grains. High temperatures favored rapid ripening of peaches and plums. Irrigation water requirements, however, increased due to the warm weather and lack of precipitation. High temperatures on the 21st contributed to some sunburn in walnuts. At Sacramento temperatures of 90° or higher were recorded on 28 days, equaling the previous record for July at that station set in 1945. Clear skies every day with 100 percent of possible sunshine at Sacramento resulted in the third July in 50 years with 100 percent of possible sunshine at that station.

High temperatures on many days in the lower San Joaquin Valley resulted in rapid ripening of fruits, such as, peaches and apricots and together with low relative humidities were favorable for fruit drying. Warm weather was particularly beneficial for the cotton crop which continued one to two weeks later than usual for this time of year. Vineyards continued in good condition except for some very small amount of sunscald, especially in Muscats.

Weather in the upper San Joaquin Valley was generally favorable for crops. Warm weather beginning in the latter portion of June and continuing through July resulted in considerable growth in cotton. Cool weather in the spring retarded top growth of cotton while cotton plants developed a strong root system. Although cotton plants appeared stunted in height, they were reported healthy and vigorous and putting on a greater-than-usual number of blossoms.

Much-above-normal temperatures in the Santa Maria area during the second week were unfavorable for pepper plants and lettuce. Considerable 'tipburn' was reported on lettuce due largely to the hot weather. In the San Luis Obispo district high temperatures contributed to some sunburning of walnuts. At Santa Maria the average daily maximum temperature of 74.4°, was the highest average daily maximum ever recorded in July at that station for the 11 years of record. The maximum temperature of 104° on the 10th at Santa Maria was the highest temperature ever recorded during July and was also the highest temperature ever recorded during the past 11 years of record at that station.

Above-normal temperatures in the Los Angeles area were favorable for the rapid development of grapes, beans, corn, tomatoes, and other crops. Rapid maturing of deciduous fruits resulted in some small losses due to forced handling. Hot weather on the 11th, 12th, and 13th contributed to some sunburning of exposed walnuts and tomatoes. A relatively heavy drop of Valencia oranges was reported following the hot spell. Some drop was also reported in mature Valencia oranges. High temperatures also contributed to a poor crown set in late-planted lima beans. Heavy irrigation was required in all fields and orchards. Pest control operations were retarded somewhat by the hot weather. At Los Angeles the average temperature, 74.9°, was the second highest of record at that station.

In the San Diego area favorable weather prevailed for the development of crops and harvesting operations. A warm period occurred from the 8th to the 13th.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observation; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

* And also on a later date or dates.

\+ Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price 15 cents per copy, monthly and annual: $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1953

CALIFORNIA - AUGUST 1953

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 316 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 72.7° or 1.8° below the weighted mean. The unweighted average temperature based on the same 316 stations was 70.3° or 2.0° below the unweighted mean. This was the coolest August since 1941 when an average temperature of 70.0° obtained. Other years since 1897 with an unweighted average temperature of 70.3° or less for August are as follows: 1911, 70.1°; 1912, 70.2°; 1925, 70.3°. The highest temperature for the State, 120°, was recorded in Death Valley at Cow Creek on the 19th and at Greenland Ranch on the 8th and 20th. The lowest temperature, 26°, was recorded at Boca in Nevada County on the 4th.

The average precipitation for the State based on 320 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.25 inch or 0.10 inch above the weighted mean. The unweighted average based on the same 320 stations was 0.23 inch or 0.12 inch above the unweighted mean. Based on 537 stations listed in Table 3 the unweighted average was 0.21 inch or 0.10 inch above the unweighted mean. Crescent City in Del Norte County reported the greatest monthly total precipitation, 3.06 inches. Crescent City also recorded the greatest daily total, 2.06 inches, on the 26th. The greatest monthly total and greatest daily total precipitation at Crescent City exceeded all previous amounts on record for August for the 64-year period of record at that station. The previous greatest monthly total was 2.13 inches in August 1943 and the previous greatest daily total, 1.35 inches, was recorded on August 18, 1924 and August 2-3, 1947. Two hundred and six stations, mostly in southern California, reported no precipitation, and 55 stations reported only a trace.

A very unusual storm during the last week brought locally heavy precipitation at many stations in northern California. At a number of stations the previous greatest daily total precipitation and previous greatest monthly total for August were equaled or exceeded as indicated in the table of Comparative Precipitation Data for August, on Page 189 of this bulletin.

Rains in the north coastal area during the last week were of considerable benefit to agriculture.

In some districts of the central coastal area weather was too cool for optimum development of some crops. In the main, weather conditions were favorable for all harvesting operations and many crops progressed satisfactorily.

Favorable weather conditions prevailed in the upper Sacramento Valley for most crops and farming operations. Light rains hampered alfalfa and prune harvesting but contributed to a considerable reduction of fire danger in forests. The maximum temperature of 66° recorded at Red Bluff on the 29th was the lowest daily maximum temperature ever recorded for August at that station. The only measurable precipitation at Red Bluff during the month was 0.10 inch on the 29th which was the first measurable precipitation in 80 days at that station. A total of five heating degree days for the month was also the greatest degree-day accumulation on record at Red Bluff for August.

Cool weather in the lower Sacramento Valley during the first week was favorable for pastures but retarded maturity of pears to some extent. Cool weather during the last week reduced irrigation water requirements and slightly retarded the rate of development of rice. The cool spell during the last week terminated in a storm bringing the greatest August precipitation of record, 0.67 inch, to Sacramento on the 29th.

Well-below normal temperatures in the lower San Joaquin Valley were unfavorable for cotton, contributing to a slower rate of growth and development and some wilt. High relative humidities, however, on several mornings, were ideal for hay-baling operations. Cool weather together with high relative humidities contributed to some splitting and souring of figs. Well-below normal temperatures during the last week also slowed development of cotton and maturation and sugaring of Thompson seedless grapes. At Fresno August was the coolest since 1900 and the third coolest on record. The average daily maximum temperature of 91.0° was the lowest recorded in August at that station since records began in 1888. The highest temperature for the month was 101° at Fresno. A lower monthly maximum temperature was reported at Fresno in 1899, 100°, and an equal monthly maximum temperature of 101° in 1941. The growing season during spring and summer was one of the coolest of record for this area.

Well-below normal temperatures during the first and last weeks in the upper San Joaquin Valley slowed development of cotton. This August was the coolest at Bakersfield since 1912.

Foggy, cloudy weather in the Santa Maria area was somewhat unfavorable for some crops. In the Santa Barbara district foggy weather contributed to blight damage in walnuts. The squash crop was slowed to some extent by cool days.

Cool weather in the Los Angeles area was favorable for all crops and harvesting operations. The drop of citrus fruit decreased, and favorable conditions prevailed for pest control operations in citrus groves. Morning fogs and moderate daytime temperatures in coastal districts, however, slowed development of lima and blackeye beans.

Crops and harvesting operations in the San Diego area progressed under favorable weather conditions. Grapes in coastal sections which sustained drought and cold weather at blossoming time yielded only about 25 to 50 percent of the normal crop. Many crops in the county manifested detrimental effects from rainfall deficiencies of the previous winter. Hay and grain crops produced about only one-half the normal yield.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

\ Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WEATHER SUMMARY

The average temperature for the State based on 317 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 72.0° or 2.3° above the weighted mean. The unweighted average based on the same 317 stations was 70.2° or 2.1° above the unweighted mean. The highest temperature for the State, 118°, was recorded at Cow Creek in Death Valley on the 12th. The lowest temperature, 20°, occurred at Boca in Nevada County on the 30th.

The average precipitation for the State based on 323 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.04 inch or 0.31 inch below the weighted mean. The unweighted average based on the same 323 stations was 0.04 inch or 0.30 inch below the unweighted mean. Based on 540 stations listed in Table 3 the unweighted average was 0.03 inch or 0.31 inch below the unweighted mean. Klamath in Del Norte County reported the greatest monthly total precipitation, 2.21 inches, and also the greatest daily precipitation amount, 1.80 inches, on the 30th. Three hundred seventy-six stations in southern and central California reported no measurable precipitation, and 77 stations reported only a trace. September 1953 was the driest September since 1937 when an average of 0.04 inch obtained. In 1902 the average precipitation for September was 0.01 inch, and in 1899, 0.03 inch.

Due to above-normal temperatures and the general lack of precipitation during the first three weeks, soils in the north coastal area remained very dry. Rains during the last week were very beneficial for germination of grasses.

Much-above normal temperatures in the central coastal area during the second week were favorable for ripening of tomatoes, sugaring of grapes, and rapid development of other crops. Cool, foggy weather in the Salinas district during the latter portion of the month contributed to considerable mildew on some vegetable crops and ornamental plants. Blight was reported severe on potatoes, and mold appeared on tomatoes.

Much-above normal temperatures in the upper Sacramento Valley during the second week were very beneficial for prune-drying operations. Showers in some portions in Shasta County on the 15th were beneficial for germination of grasses in grain fields but hampered harvesting of remaining grains. At Red Bluff a maximum temperature of 109° occurring on the 10th, 13th, and 14th was reported as the highest for the year, also the highest for so late in the season at that station. Generally, the weather was considered very good for harvesting activities except for some cloudy and threatening days which did not favor prune harvesting and drying.

Much-above normal temperatures in the lower Sacramento Valley during the second week were unfavorable for tomatoes with considerable sunscalding reported. High temperatures together with high relative humidities resulted in considerable mold in tomatoes and rejection of about 10 percent of the crop delivered at canneries. High temperatures also contributed to some sunburn damage in walnuts. Above-normal temperatures, however, were favorable for the development and maturing of rice. At Sacramento WB City the maximum temperature of 103° on the 13th was the highest temperature ever recorded for that date at that station.

Well-above normal temperatures in the lower San Joaquin Valley during the second week were very favorable for maturing of figs; however, the fig crop sustained considerable spoilage by splitting and souring due largely to previous cool weather and high relative humidities. Grapes were reported moving to wineries later than last year due to slowness to reach acceptable sugar content resulting largely from the cool weather in August. Despite the hot weather during the second week cotton was reported from a week to 10 days late.

Although temperatures in the upper San Joaquin Valley averaged above normal, cotton and grapes were from 10 days to two weeks later than usual due to cool weather earlier in the season.

Weather in the Santa Maria area was generally favorable for most crops; however, high temperatures on some days during the second week contributed to some tipburn on lettuce.

Generally cool weather in the Los Angeles area during the first week favored harvesting activities and pest control operations and decreased irrigation water requirements. Temperatures were high enough for satisfactory growth and development of seasonal crops. High temperatures and low relative humidities during the second week were generally unfavorable for growing crops and farming operations. Irrigation water requirements for field crops, orchards, and pastures were heavy. Pest control operations were curtailed due to high temperatures. Heat hastened maturing of some crops but contributed to some sunburn in some exposed walnuts and tomatoes. Cooler weather during the last half of the month was favorable for growing and harvesting of crops and pest control operations.

All crops and harvesting activities in the San Diego area progressed under seasonable weather conditions.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 8.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

• Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1953

CALIFORNIA - OCTOBER 1953

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 317 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 61.0° or equal to the weighted mean. The unweighted average temperature based on the same 317 stations was 60.4° or equal to the unweighted mean. The highest temperature, 106°, was recorded at four stations in southern California; Indio U. S. Date Garden in Riverside County on the 4th, Corona in Riverside County on the 5th, Escondido Church Ranch in San Diego County on the 4th and 5th, and El Capitan Dam in San Diego County on the 5th and 6th. The lowest temperature, 15°, was recorded at Boca in Nevada County on the 3d.

The average precipitation for the State based on 324 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.74 inch or 0.56 inch below the weighted mean. The unweighted average based on the same 324 stations was 0.75 inch or 0.63 inch below the unweighted mean. Based on 555 stations listed in Table 3 the unweighted average was 0.77 inch or 0.61 inch below the unweighted mean. Crescent City 8 NE in Del Norte County reported the greatest monthly total precipitation, 8.51 inches. Strawberry Valley at an elevation of 3784 feet in Yuba County recorded the greatest daily precipitation amount, 3.55 inches, on the 18th. There were 119 stations mostly in southern California reporting no precipitation, and 36 stations reporting only a trace.

Substantial rains in the north coastal area during the second and third weeks eliminated fire danger in forests and were beneficial for grasses and other range feeds but unfavorable for harvesting of potatoes and carrots. Rains were also beneficial for fall plowing and grain seeding operations which were well under way by the end of the month.

Warm weather in the central coastal area during the first week was very favorable for maturing of apples and tomatoes and sugaring of grapes, but high temperatures contributed to considerable sunscald in tomatoes in the Salinas district. Rains during the second decade were unfavorable for grape harvesting but beneficial for walnut harvesting. In many districts rains were sufficient to start growth of grasses in pastures and ranges. The lack of precipitation during the last decade was favorable for harvesting of grapes; however, more precipitation was needed for fall grain crops.

Rains in the upper Sacramento Valley during the second decade were beneficial for walnut harvesting but unfavorable for baling of late alfalfa. Rains also resulted in cracking of some tomatoes and melons. Rains on walnuts resulted in bursting of the outer covering contributing to economical harvesting. Dry weather during the last decade was unfavorable for growth of grasses in winter pastures and prolonged irrigation. Sheep were moved from mountain pastures to the valley, and some early movement of cattle from mountain ranges was necessary.

Dry, north winds in the lower Sacramento Valley from the 19th to the 22d were beneficial for some activities but detrimental to others. They were favorable for drying of tomato vines thus decreasing mold and for lowering the moisture content of rice and milo. The dry winds were unfavorable for windrowed fields of seed crops as considerable shattering obtained. Also, some harvesting operations were delayed, particularly in tomatoes. The fastest mile, 53 miles per hour on the 21st with a gust to 55 mph, was the strongest north wind of record at Sacramento. The lack of precipitation was unfavorable for some crops.

Warm, dry weather in the lower San Joaquin Valley during the first decade was ideal for raisin drying with drying operations virtually completed. Harvesting of rice, alfalfa seed, sugar beets, and silage corn progressed under favorable conditions. Cotton defoliation continued with some picking under way. During the second decade weather was, in the main, favorable for farming operations. Considerable dew obtained in mornings, but on several occasions fog prevented spraying and dusting by aircraft. Light rains in foothill districts of Madera County on the 18th resulted in washing of some molasses from dry forage. Molasses is sprayed on dry forage at weekly intervals, and rain or heavy dew causes molasses to run off the plant stems. Strong winds on the 18th and 21st resulted in an estimated $300,000 loss to the lima bean crop on the west side of Stanislaus County. A light frost was reported in the vicinity of Madera on the 22d but no damage to olives or corn was reported. The cotton crop remained about a week or two late for this time of year in some districts. Dry, sunny weather during the last decade was favorable for cotton picking operations. Dry weather conditions with insufficient dew on some mornings, however, slowed dusting operations for cotton defoliation. Fig harvesting was virtually completed with a short crop of lower quality than usual due to cool, humid weather in August and early September, which contributed to slow drying and some splitting. The incidence of mold was reported higher than usual, and many growers abandoned crops because of souring which was caused largely by spreading of the pathogen by vinegar flies.

Light rains in the upper San Joaquin Valley during the third week were insufficient to be of any benefit to crops. Scattered, light frosts in low places in some districts on the 23d and 24th resulted in little or no damage except in a few acres of string beans south of Arvin in which tops were nipped slightly.

Much-above normal temperatures in the Santa Maria area during the first week were detrimental to some crops. Tomatoes in the Santa Barbara district sustained some sunscald, and pole beans in the San Luis Obispo district were damaged to some extent. Foggy weather in the Santa Maria district during the month contributed to some pink rot in celery. For the most part, weather remained favorable for crops and farming activities.

Much-above normal temperatures in the Los Angeles area from the 3d to the 8th curtailed pest control operations, stopped bean cutting, and increased irrigation. Considerable losses were reported in beans due to shattering. High temperatures and low relative humidities resulted in considerable heat damage to new growth in citrus and avocados, and some fruit blemish on exposed fruit. Cooler weather for the remainder of the month was more favorable for crops and pest control operations. Well-above normal temperatures again on the 27th and 28th interrupted pest control operations and increased demands for irrigation water. At Los Angeles the average temperature of 69.1° resulted in the fifth warmest October in 76 years at that station.

In the San Diego area much-above normal temperatures from the 3d to 6th caused minor damage to tomatoes and some sunscald in both foliage and fruit on orange trees. Widely scattered showers in the San Diego area on the 22d were generally too light to add much moisture to soils. Precipitation amounts in the Fallbrook-Oceanside district of about one-half inch were extremely beneficial. At San Diego the average temperature, 67.4°, was the third highest on record for October at that station. The highest average for October, 68.1°, occurred in 1918.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 5, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

F Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing, see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1954

CALIFORNIA - NOVEMBER 1953

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 309 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 53.4° or 1.4° above the weighted mean. The unweighted average temperature based on the same 309 stations was 53.5° or 1.4° above the unweighted mean. The highest temperature, 99°, was recorded at Indio U. S. Date Garden in the Coachella Valley on the 1st. The lowest temperature, 1°, was recorded at Big Bear Lake Dam in San Bernardino County on the 21st.

The average precipitation for the State based on 319 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 2.66 inches or 0.35 inch above the weighted mean. The unweighted average based on the same 319 stations was 2.88 inches or 0.39 inch above the unweighted mean. Based on 546 stations listed in Table 3, the unweighted average was 3.08 inches or 0.59 inch above the unweighted mean. The greatest monthly total precipitation, 24.94 inches, was reported from Gasquet Ranger Station in Del Norte County, California. The greatest daily total, 8.15 inches, occurred at Gasquet Ranger Station on the 23d. Five stations in the southeastern interior reported no precipitation, and three stations reported only a trace.

Soda Springs at an elevation of 6752 feet in Nevada County, reported the greatest total monthly snowfall, 30.5 inches; Twin Lakes, at an elevation of 7920 feet in Alpine County, reported 28.5 inches; Blue Canyon Weather Bureau, 27.3 inches; Cisco Ranger Station, 23.3 inches; Bowman Dam, 21.0 inches; and Huntington Lake, 20.0 inches.

Above-normal temperatures and much-above-normal precipitation in the north coastal area were favorable for pastures and ranges. Continued wet weather curtailed field operations. Heavy rains from the evening of the 21st to the early morning of the 23d over the extreme northwestern portion of California and southwestern portion of Oregon resulted in floods on the Smith River in California and on the Coquille River in Oregon. On the Smith River, near Crescent City, the preliminary provisional peak discharge on the 24th was reported as 141,000 cfs. Recent peak discharges on the Smith River near Crescent City equal to or greater than the peak on the 24th were as follows: January 18, 1953, 141,000 cfs; October 29, 1950, 152,000 cfs. The later peak discharge is also the greatest at this station for the period of record, 1931 to date. All roads north and east of Crescent City were blocked by slides or washed out. Considerable losses were reported in livestock. At Elk Valley, 8.12 inches of precipitation on the 22nd was the greatest daily total for the 13 years of record at that station; the previous greatest daily total on record was 7.16 inches for December 27-28, 1945. A table of comparative precipitation data referring to the heavy rains in the north coastal area for the period November 21-23, 1953 will be found on page 266.

Rains in the central coastal area during the second and third decades were beneficial for ranges and newly seeded pastures and grain crops. Additional precipitation was needed for grasses and other crops in Monterey County. Strong winds on the 13th resulted in many broken branches, disrupted power lines, and damaged signs in the San Francisco Bay Region.

Continued dry weather in the upper Sacramento Valley during the first week was favorable for harvesting of late crops but unfavorable for winter pastures and ranges which were in need of precipitation. Rains during the second week were detrimental to sugar beet and milo harvesting and contributed to some delay in cutting of alfalfa. Moderate temperatures and adequate soil moisture were very favorable for growth of grasses. Olive harvesting was slowed as a result of wet trees and mud in orchards. Irrigation was suspended on irrigated pastures.

Harvesting of crops in the lower Sacramento Valley progressed rapidly during the first week despite periods of threatening weather with most harvesting activities in final stages. Moderate temperatures and precipitation during the second week were favorable for growing crops especially range and pasture grasses. Wet field conditions, however, delayed sugar beet and rice harvesting. Strong winds on the night of the 13th resulted in some damage to trees. The fastest mile of wind speed at Sacramento Municipal Airport was reported as 70 miles per hour from the southeast. The lowest temperatures recorded so far this season occurred on the 18th and 19th with many outlying districts reporting light to moderate frost. Rainy, foggy weather during the last week generally slowed farming activities except on higher ground where planting of grain crops continued. Some sugar beet fields were left unharvested due to wet weather, but pruning of orchards progressed on a near-normal schedule. Ten days of fog at Sacramento equalled the greatest on record number of days with fog in November established in 1883. The percent of possible sunshine at Sacramento, 36 percent, was the least since 1905 when sunshine records began.

Rains in the lower San Joaquin Valley on the 14th interrupted cotton picking operations but favored growth of grasses on ranges and pastures. Some fall seeding of alfalfa was delayed by rains; fields previously planted benefited from the added moisture. At Fresno the precipitation on the 14th was very heavy for short periods; 0.35 inch occurred in 30 minutes; 0.44 inch in one hour; and 0.64 inch in two hours. These were the greatest intensities on record for time periods indicated for the month of November at that station. Cloudy, foggy weather during the last week contributed to delaying of cotton picking with cotton reported about 50 percent harvested by the end of the month.

Dry, mild weather in the upper San Joaquin Valley during the first half of the month was ideal for cotton picking which was at the peak. The deficiency of rainfall during the first portion of the month was of great concern to livestock farmers. Rains on the 14th temporarily delayed cotton picking but benefited grasses. The combination of wind, dust, and rain resulted in some damage to cotton. Light frosts on the 18th and 19th aided in defoliating cotton. Light rains on the 19th and 20th contributed to a slight lowering of cotton grades. Rain and fog during the last week slowed cotton harvesting.

Weather conditions in the Santa Maria area during the first decade were generally favorable for crops except for rains which slowed threshing of beans. Some wind damage was reported in the San Luis Obispo district. Substantial rainfall on the 14th benefited most farm activities but delayed harvesting of beans. At Santa Maria 1.66 inches of precipitation occurred in an 8-hour period on the 14th. Much-above normal temperatures on the 24th and 25th together with strong winds on the 24th, contributed to wilting of some small transplanted crops with some slight losses.

Harvesting of crops in the Los Angeles area progressed satisfactorily during the first two weeks despite variable weather conditions. Light precipitation during the first week was insufficient to aid growth of pasture grasses or reduce irrigation water requirements. Substantial amounts of precipitation on the 14th relieved drought conditions and started growth of pasture grasses, small grains, and cover crops. Plowing and working of soils were increased under more favorable soil conditions. Light frost on the 19th and 21st nipped tender annual plants but resulted in no damage to citrus. Strong winds on the 17th, 18th, and 20th resulted in minor damages to signs and windows and forced down many trees, mostly west of the city of Los Angeles. Warm weather during the last week accelerated germination and growth of small grains, pasture and range grasses, and cover crops. Due to the lack of adequate precipitation after the 14th, irrigation was resumed in some orchards on reduced schedules. In the Hemet district the first severe frost of the season occurred on November 16th. At Los Angeles International Airport the maximum temperature of 90° on the 25th was the highest temperature ever recorded this late in the season at that station. Previous high temperatures recorded for this time of year were as follows: 83°, November 25, 1941; and 89°, December 3, 1940.

Rains in the San Diego area during the first week were beneficial to all vegetation and to soils in general. No damage was reported to the tomato crop due to the precipitation. Rains on the 14th, 15th, and 20th were beneficial for all growing vegetation and for plowing and working of soils. The maximum temperature of 89° at San Diego on the 25th was the highest temperature ever recorded so late in the year at that station. Tomato harvesting continued in large volume to the end of the month with a number of good fields for December harvesting. Only slight damage resulted from rains, and quality was reported especially good for this time of year.

Warm weather in the Imperial Valley during the second week was unfavorable for lettuce. Cooler weather beginning on the 18th was very favorable for lettuce. Below-freezing temperatures were reported in some lower, colder districts on the 20th.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month

VAR This entry in time of observation column in Station Index means variable.

Subscription Price 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1954

CALIFORNIA - DECEMBER 1953

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 312 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 46.4° or 0.8° above the weighted mean. The unweighted average based on the same 312 stations was 47.3° or 1.2° above the unweighted mean. The highest temperature, 92°, was recorded at Santa Ana Fire Station in Orange County on the 14th. The lowest temperature, -2°, occurred at Big Bear Lake Dam at an elevation of 6815 feet in San Bernardino County on the 30th.

The average precipitation for the State based on 318 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 1.04 inches or 2.94 inches below the weighted mean. The unweighted average based on the same 318 stations was 1.05 inches or 3.38 inches below the unweighted mean. Based on 544 stations listed in Table 3, the unweighted average precipitation was 1.13 inches or 3.30 inches below the unweighted mean. December 1953 was the driest December since 1930 when the unweighted average precipitation was 0.47 inch, and was also the second driest December on record since 1897 when average precipitation amounts were first computed.

Snowfall was generally well-below normal but not the lightest on record. The greatest snowfall was reported from Soda Springs at an elevation of 6752 feet above mean sea level in Nevada County where only 34.0 inches of snowfall occurred compared to a 20-year average at that station of 61.8, and 162.7 inches in December 1952, and 8.0 inches and 207.0 inches in December of 1930 and 1931, respectively. Twin Lakes at an elevation of 7920 feet above mean sea level in Alpine County reported the second greatest total for December 1953, 25.5 inches, compared to a 30-year average of 56.3 inches, and 141.0 inches in 1952, and 6.0 inches, 106.0 inches, 133.0 inches, and 144.0 inches in December of 1930, 1931, 1941, and 1951, respectively.

In the north coastal area soils remained generally too wet for farming activities due to moderate to heavy rains during the first week. By the end of the month more precipitation was needed for pastures and range feeds; however, livestock were reported doing satisfactorily with ample feed available.

Comparatively mild weather in the central coastal area during the first two weeks, for this time of year, resulted in considerable development of grasses and grain crops, and considerable progress in many farming activities. Pruning was under way in most districts, and some spraying was started. In Monterey County weather was favorable for planting of sugar beets and some lettuce and also for harvesting of vegetable crops and threshing of some late beans. By the end of the month soil moisture was generally insufficient for germination of seeds in many districts, and irrigation was necessary in many instances, for sugar beets, lettuce, and broccoli which were being planted. Additional precipitation was greatly needed for grains and grasses, particularly in Santa Clara County and other southern districts. At San Francisco December was the driest since 1917.

Rains in the upper Sacramento Valley during the first week benefited ranges at low elevations, irrigated pastures, and summer fallow grains. Irrigated pastures which normally produce only 10 percent of the roughage required at this time of year were producing about 25 percent of that required for dairy herds. Grains planted on summer fallow lands were reported from three to six inches tall and in excellent condition. Ranges were reported in excellent condition and the best in years except at high elevations where low temperatures and snow retarded growth. Dry weather during the greater portion of the month was favorable for pruning, planting, grain fertilizing, and strawberry plant harvesting; however, by the end of the month the lack of precipitation had retarded growth of grasses and grains. At Mt. Shasta December was the fifth warmest and also the fifth driest since 1888. At Red Bluff, December, with only five days with measurable precipitation totaling 0.46 inches, was the driest on record. The average daily maximum temperature at Red Bluff was the highest since 1938 at that station with the maximum temperatures on the 16th, 25th, 26th, and 27th reported as the highest on record for those dates at that station.

Above-normal temperatures in the lower Sacramento Valley were favorable for pastures and ranges. Weather was ideal for continued harvesting of sugar beets and planting of small grain crops. Orchard pruning progressed. By the end of the month, soils were generally quite dry; however, all growing crops were in good condition.

Weather in the lower San Joaquin Valley was somewhat unfavorable for a speedy completion of the cotton harvesting. Damp weather and fog slowed cotton picking. By the end of the month cotton harvesting was approaching completion under favorable weather conditions. Frost was beneficial in snapping cotton bolls open, thus aiding harvesting. Some fields of grain and alfalfa were reported in need of precipitation, but, generally, crops were growing satisfactorily. Below-normal temperatures on many days during the month were favorable for fruit trees contributing to necessary winter chilling.

Generally, very favorable weather prevailed in the upper San Joaquin Valley for cotton picking and clearing of fields for spring planting. Rains during the first week started growth of grasses; however, by the end of the month pastures were reported in only fair condition due to the extended period without sufficient precipitation.

Light rains in the Santa Maria area during the first week were very favorable for grains and grasses. However continued dry weather during the last three weeks was detrimental to ranges. By the end of the month a great need for precipitation existed for grains, grasses, and other crops. At Santa Maria the minimum temperature of 27° on the 25th was the lowest temperature at that station since January 26, 1950. Heavy frost resulted in losses in celery in low spots. Frosts also caused damage to the few remaining tomatoes and finished off the peppers. Slight wind damage was reported in the Santa Barbara district at different times during the month.

Light rains in the Los Angeles area on the 4th were only sufficient to benefit shallow-rooted crops such as grains, grasses, and cover crops. The lack of precipitation during the remainder of the month was unfavorable for all growing crops. Growth of grasses, grains, and cover crops was curtailed due to lack of adequate moisture, and irrigation was continued in orchards. A severe Santa Ana northeast desert wind condition occurred on the 11th with wind speeds estimated at from 60 to 80 mph in the Fontana district. Many trees were forced down and structural damage was reported in the Fontana district. Also extreme fire hazard conditions prevailed. In the Mt. Baldy district a forest fire raged out of control. On the 27th and 28th strong, desert winds with speeds estimated as 100 mph whipped through Cajon Pass in a broad sweep coastward; felling trees, power lines, and reducing visibility in sections of Riverside, San Bernardino, and Los Angeles Counties as dust clouds swept in. Blowing sand damaged many automobiles. Two major forest fires raced out of control before strong, gusty winds of gale force in the San Gabriel Mountains on the 27th and 28th, forcing the evacuation of hundreds of persons in upper Monrovia, Big Santa Anita Canyon, and below Camp Baldy. The forest fires spread over 14,000 acres with losses to homes, timber and watershed estimated at $6,000,000. Strong winds on the 11th, 22d, 23d, 27th, and 28th resulted in some fruit, especially Navel oranges and grapefruit, blown from trees in citrus districts. Frost occurred on the 24th and 25th and several later mornings resulting in light damage to unheated citrus in colder districts. A total of 4.08 inches of precipitation at Los Angeles resulted in the driest calendar year of record at that station. The previous driest year was 1947 when a total of only 4.13 inches occurred.

Continued dry weather in the San Diego area was very favorable for prolonging the harvesting of the tomato crop. Tomatoes were very abundant and of very good quality. Below-freezing temperatures in colder locations during the last week resulted in damage to tomatoes, squash, and peppers. Losses were not severe as tomato harvesting was nearing completion. The lack of adequate soil moisture during the month was unfavorable for germination of seeds. A total of 0.03 inch of precipitation occurred at San Diego. The total annual rainfall at San Diego, 3.41 inches, resulted in the second driest year in 104 years of record. In the driest year, 1863, San Diego had 3.02 inches of precipitation. The maximum temperature of 83° on the 14th equalled the highest temperature of record for that date at San Diego.

In the Imperial Valley cold weather during the first portion of the month slowed lettuce harvesting while strong winds resulted in some damage to new alfalfa plantings.

CORRECTED DATA

DECEMBER 1952	MENDOTA DAM:	Precipitation on 28th should be .19, monthly total 2.41.
ANNUAL 1952	COW CREEK:	Temperature mean for July 1952 should be 102.4° and August 1952, 102.2°.
	GREENLAND RANCH:	Temperature mean for July 1952 should be 100.9° and August 1952, 102.2°.
FEBRUARY 1953	CAMPO:	Lowest temperature should be 12° on 23rd.
	DOWNIEVILLE RS:	Min. temperature on 9th should be 31°.
	MINERAL:	Precipitation on 17th should be Trace, monthly total .74, departure -6.77 and days with .01 or more 5, .50 or more 0 and 1.00 or more 0.
	SANTA CLARA UNIV:	Max. temperature on 15th should be 62° and min. temperature 39°.
MARCH 1953	OAKLAND FIN CENTER:	Precipitation on 18th should be .00; 19th, 1.05; 20th, .05; monthly total 1.95; greatest day 1.05 on 19th and days with .01 or more 5, .50 or more 1 and 1.00 or more 1.
	OJAI:	Date of lowest temperature should be on the 3rd only.
	SANTA MONICA PIER:	Precipitation on 20th should be .25, monthly total .27, departure -2.15, greatest day .25 on 20th and day with .01 or more 2.
APRIL 1953	BERKELEY:	Temperature departure from normal should be -1.1°.
	COLFAX:	Precipitation on 9th should be .00, monthly total 8.64, departure 4.74, greatest day 3.88 on 27th total snowfall 5.0 and days with .01 or more 10, .50 or more 4, 1.00 or more 3.
	GRASS VALLEY:	Temperature departure from normal should be -1.5°.
	POINT PIEDRAS BLANCAS:	Precipitation on 30th should be .13, monthly total 2.57, departure 1.34 and days with .01 or more 8, .50 or more 1 and 1.00 or more 1.
	UPPER LAKE 7 W:	Precipitation on 8th and 11th should be .00 and monthly total 3.75.
	WEAVERVILLE RS:	Lowest temperature should be 20° on 1st.
MAY 1953	BERKELEY:	Temperature departure from normal should be 0.7°.
	SALT SPRINGS PH:	Min. temperature on 9th should be 32°.
	SCOTIA:	Min. temperature on 9th should be 41°.
JUNE 1953	BERKELEY:	Temperature departure from normal should be 0.9°.
	SANTA ANA FIRE STA:	Delete entire record, complete record will be found in December 1953 Delayed Data.
	SKAGGS SPRINGS LOS LOMA:	Precipitation on 6th should be .65; 7th, .15 and monthly total .80.
	WHITTIER CITY HALL:	Precipitation on 7th should be .01, monthly total .01.
AUGUST 1953	EAST PINE FLAT:	Precipitation on 11th should be .19 and monthly total .19.
SEPTEMBER through NOVEMBER 1953	OPIDS CAMP FC 57 B:	Delete all temperature record for the months indicated.
OCTOBER 1953	HOEGEES CAMP IVY:	Precipitation on 22nd should be .20 and monthly total .20.
NOVEMBER 1953	MAD RIVER RS:	Precipitation on 30th should be accumulated (*) and monthly total accumulated (*).

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in °F precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4 30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST and Blue Canyon WB AP 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing, see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price 15 cents per copy, monthly and annual; $1 50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

MAP WILL BE FOUND FOLLOWING PAGE 285 AND CORRECTED DATA ON PAGE 302.

ANNUAL SUMMARY 1953

Volume LVII No. 13

CHATTANOOGA: 1954

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

In 1953 much-above normal temperatures characterized the month of JANUARY and much-below normal precipitation. the month of FEBRUARY. MARCH, APRIL, MAY, and JUNE were generally cool with greatest below-normal temperature anomalies occurring in MAY and JUNE. JULY was a good month for agriculture, and AUGUST was characterized by an unusual storm during the last week with unprecedented precipitation amounts reported at many stations in northern California. Warm, and very dry weather occurred during SEPTEMBER with dry conditions continuing generally to the end of the year except for a period in NOVEMBER with heavy rains occurring in northern California resulting in flooding on some rivers and smaller streams. Very hot weather occurred in the south coastal area during the last week of NOVEMBER. Temperatures during DECEMBER were generally above normal throughout the State; however, precipitation was well-below normal, ranging from about five percent of normal in southern California to about 40 percent of normal in northern portions.

Much-above normal temperatures in JANUARY and above-normal temperatures in FEBRUARY contributed to early blossoming of deciduous fruit trees. Extremely dry weather during FEBRUARY was unfavorable for grains and grasses with the precipitation ranging from virtually zero percent of normal over the Central Coast Drainage and four percent of normal over the San Joaquin Drainage, to 28 percent of normal in the North Coast Drainage or 13 percent of normal for the entire State, based on the weighted mean. Frosts during the first several days of MARCH resulted in considerable damage to figs in the San Joaquin Valley. Cool weather from MARCH through JUNE was generally unfavorable for fruits as conditions favored development of mildew and blight. The continued cool weather during the spring delayed ripening of apricots and other fruits. Although JULY was favorable for crops, AUGUST was too cool for optimum development. Generally warm, dry weather from SEPTEMBER through DECEMBER was favorable for prolonging harvesting of tomatoes and other crops, in southern California. Heavy rains in northwestern California from NOVEMBER 21st to 23d resulted in considerable flooding on the Smith River and other streams in that vicinity. In southern California precipitation averaged generally well-below normal in each month of the year.

SYNOPSIS BY MONTHS

JANUARY was the warmest on record with an unweighted average temperature of 49.6° exceeding the previous record average of 48.5° for January 1920. All stations reported average temperatures well-above normal with stations in the Sierra Nevada and other interior areas reporting the greatest anomalies. In northern portions of the State and Sierra Nevada much-above normal average temperatures obtained largely as a result of average daily minimum temperatures being greater than any previous average daily minimums for the period of record at many stations. In southern portions of the State both average daily maximum temperatures and average daily minimum temperatures were greater than any previously recorded at many stations. Precipitation was well-above normal in northern California, but due to much-above normal temperatures, a large portion fell as rain at high elevations and resulted in above-normal to much-above normal runoff rather than the usual increase in snowpack storage. Heavy rains from the 16th to 18th resulted in flooding on practically every river and stream in the northwestern portion of the State. On the Klamath River, near the city of Klamath, the provisional peak discharge on about the 17th was reported as 285,000 cfs compared to the previous peak discharge of 195,000 cfs reported on February 2, 1952. Flooding also occurred on the Smith River but with peak stage reported lower than in October 1950. Flood damages were estimated in the millions of dollars with greatest losses reported to roads, culverts, and small bridges. A special report from the Red Cross indicated that in northern California the floods resulted in 8 deaths, 30 injuries, 30 homes destroyed, 50 homes damaged to a major extent, 131 homes damaged to a minor extent, five other buildings destroyed, five other buildings damaged to a major extent, and 75 other buildings damaged to a minor extent. Above-normal temperatures in the central coastal area contributed to bringing on early blossoming and early fruiting of some early berries and blossoming of some fruit trees in the Santa Clara Valley. In Sonoma County buds started to swell on prune trees, particularly the Imperial variety by the end of the month. In the upper Sacramento Valley wet, damp conditions during the first three weeks kept farming activities virtually at a standstill; however, much-above normal temperatures during the second week and generally above-normal temperatures otherwise were favorable for development of grasses and grains but were unfavorable for optimum winter chilling of fruit and nut trees. At Red Bluff this was the first January since 1885 in which no freezing temperatures were observed. Much-above normal temperatures in the lower Sacramento Valley contributed to rapid development of almond buds. At Sacramento the average daily maximum temperature was the highest since 1909, but the average daily temperature was the highest of record for January. The minimum temperature of 58° on the 9th was the highest minimum temperature ever recorded at Sacramento in January, exceeding by 2° the previous highest January daily minimum. Daily maximum temperatures on the 8th and 9th exceeded the previous record maximums for those dates at Sacramento. Rainfall and much-above normal temperatures in the lower San Joaquin Valley were very beneficial for range grasses, cover crops, and winter grains. At Fresno January was the second warmest on record. The maximum temperature at Fresno on the 9th, 70°, was the highest maximum ever recorded on that date at that station. A minimum temperature lower than 32° was observed on only one day. Much-above normal temperatures in the Los Angeles areas resulted in rapid growth of grasses, grains, and cover crops. Deciduous fruit buds developed early with some blossoming of ornamentals reported in the Metropolitan area. Saucer peaches came into bloom in most districts. At Los Angeles January was the third warmest of record. At San Diego January was the warmest on record with the maximum temperature of 88° on the 10th being the highest temperature ever recorded in January at that station. Maximum temperatures on the 10th, 23d, 29th, 30th, and 31st exceeded previous high temperatures for those dates at that station.

FEBRUARY with an unweighted average precipitation of 0.50 inch or 4.04 inches below the unweighted mean was the driest February since 1899 when an unweighted average precipitation for the State of 0.45 inch was recorded and the second driest February based on the period of record beginning with 1897. In only three previous years the unweighted average precipitation for the State was reported less than one inch for the month of February; 1900, 0.94 inch; 1912, 0.75 inch; and 1933, 0.83 inch. Past records indicate that for the period prior to 1897 February precipitation was very light in 1896, 1886, 1885, and 1875; however, average precipitation values for the State for these years are not available. In February 1953 precipitation averaged 13 percent of normal throughout the State with greatest deficiencies reported in the Central Valley and central coastal area where virtually no precipitation occurred in the Central Coast Drainage, only 4 percent of normal precipitation in the San Joaquin Drainage, and about 7 percent of normal precipitation in the Sacramento Drainage. In large portions of central California no measurable precipitation was reported. As the month ended in central California, many stations recorded a period of 38 days without measurable precipitation. In Ventura County some stations recorded a period of 45 rainless days. In Imperial, Riverside, San Bernardino, and Inyo Counties some stations recorded up to 70 days without measurable precipitation at the close of the month. As a result of the light precipitation and generally above-normal temperatures, snowfall was generally very light except in scattered mountain districts in southern California. Two stations, both in southern California, reported a total of 20.0 inches or more of snowfall; Raywood Flats at an elevation of 7200 feet in San Bernardino County, 21.5 inches, and Big Pines Park FC 83 at an elevation of 6860 feet in Los Angeles County, 20.0 inches. At Soda Springs at an elevation of 6752 feet in Nevada County, in the Sierra Nevada, the six inches of snowfall for February 1953 was the least snowfall at that station for February since records began at that station in March 1930. The previous record-low February snowfall at Soda Springs was 16.0 inches in 1947. The continued lack of precipitation resulted in starting of irrigation in row crops in Monterey County and some other districts during the last half of the month. At San Francisco February was the driest since 1864 when no rain occurred during the entire month and the second driest since records began in October 1849 at that station. Warm, dry weather in the upper Sacramento Valley during the first half of the month following the previous wet spell was very favorable for growth of grains and grasses but unfavorable for fruit and nut trees which had not experienced adequate winter chilling. Buds on some types of trees began to swell due to the warm weather. Almonds and apricots blossomed early as a result of the above-normal temperatures. The lack of adequate precipitation together with drying, northerly winds had a very desiccating effect upon grasses and grains during the latter portion of the month. At Red Bluff February was the driest since 1899. At Mount Shasta February was the driest since 1896 when only 0.21 inch of precipitation was recorded. The maximum temperature of 71° at Mount Shasta on the 27th was the highest maximum tempera-

ture recorded at that station for the month of February since 1917. In the lower Sacramento Valley drying, northerly winds during the month had a very desiccating effect upon grains, alfalfa, and grasses, and other crops. Irrigation was necessary in alfalfa, and grains manifested a great need for moisture in many places. At Sacramento February was the driest since 1913. The 0.03 inch of precipitation at Sacramento from January 21st through February 27th resulted in one of the longest midwinter droughts of record, the longest since January-February 1917. In the lower San Joaquin Valley above-normal temperatures contributed to early blossoming of some fruit trees. Drying winds were unfavorable for crops. By the end of the month pastures were reported in great need of more precipitation, and irrigation was beginning in some districts. At Fresno February was the driest since 1912. In the upper San Joaquin Valley frosts on the 19th, 20th, and 21st resulted in freezing of practically all potato plants which had emerged above the ground. The lack of adequate precipitation during the month was unfavorable for unirrigated grains and grasses. Below-normal temperatures during the latter portion of the month generally retarded blossoming on fruit trees; however, peaches and prunes were in full bloom in some districts. In the Santa Maria area grain crops in open, flat lands had deteriorated beyond the stage where precipitation would have been helpful. Frosts during the last decade resulted in considerable damage to artichokes and some damage to alfalfa in spots. In the San Luis Obispo district about half of the almond crop was reported damaged by frost. In the Los Angeles area frosts during the third decade resulted in an estimated damage of 10 to 15 percent of unheated citrus districts. Considerable damage was also sustained by deciduous fruit buds and blossoms in the Beaumont district. The lack of sufficient precipitation together with drying, northeasterly winds during the first 22 days in the San Diego area made considerable irrigation necessary. Cold weather during the last decade resulted in some damage to tender garden vegetables and some fruit which had set early.

In MARCH below-normal precipitation was generally unfavorable for crops. In the central coastal area the lack of adequate rainfall during the first decade was very unfavorable for grasses, field crops, and truck crops. Frosts on the 1st, 2d, and 3d resulted in considerable damage to prunes, pears, peaches, apricots, almonds, artichokes, and some other crops. In the upper Sacramento Valley continued below-normal precipitation together with drying, northerly winds had a very desiccating effect upon grains and grasses. Below-freezing temperatures during the second decade contributed to some damage in almonds, peaches, and prunes in unheated orchards. At Red Bluff the total precipitation for the 2-month period, February-March, 0.81 inches, equaled the least amount for that 2-month period established in 1923. The fastest mile of wind on the 19th at Red Bluff was recorded as 63 mph from the SE which exceeds the previous fastest mile at that station, 60 mph from the SE, recorded in December 1952. Below-freezing temperatures in the lower San Joaquin Valley on the 1st, 2d, and 3d resulted in considerable orchard heating in almonds, prunes, and some other crops. The minimum temperature of 26° at Fresno on the 2d was the lowest temperature ever recorded at that station for the month of March. On the 2d below-freezing temperatures in the Fresno area resulted in considerable damage in fig districts with as much as 100 percent of the terminal buds killed in some places. The lack of adequate precipitation contributed to an increase in the serious drought conditions. Generally irrigated grains remained in satisfactory condition, but unirrigated grains were reported, for the most part, worthless except for sheep pasture. At Santa Maria precipitation on the 1st had little effect in alleviating the drought, and pastures and ranges continued in extremely dry condition. Light hail on the 1st caused some slight damage to mature lettuce and some newly-thinned young lettuce. The total precipitation for the 2-month period of February-March, 0.91 inch, was the least total for that 2-month period since 1900. The previous least February-March total since 1900 was 1.24 inches in 1923 and 1933. Light rains in the Los Angeles area on the 19th and 20th were of some benefit to shallow-rooted crops but insufficient to penetrate subsoils. Irrigation in orchards continued on near summertime schedules.

In APRIL temperatures averaged below normal, but precipitation was generally well-above normal, except in southern California where generally below-normal amounts obtained. Snowfall was well-above normal at many stations in the Sierra Nevada with six stations reporting totals of more than 40.0 inches. At Lake Spaulding at an elevation of 5075 feet in Nevada County, the total snowfall for April, 45.5 inches, was 28.5 inches above the long-period mean and exceeded only by the 81.8 inches which occurred in April 1948. In the central coastal area heavy frosts during the second week resulted in considerable damage to fruits and nuts. In Mendocino County frosts on the 8th hit some walnuts that were out early and contributed to some damage to pears and prunes. Most grapes had not advanced enough to sustain frost damage in Mendocino County. In Lake County heavy frosts on the 8th and 9th caused considerable damage to prune and pear crops. On the morning of the 7th severe frost damage was reported in Sonoma County with prune crop most severely affected; losses were reported up to 75 percent for the county. Grapes, pears, walnuts, and some apples were also damaged. In Napa County the major freeze which invaded the Napa Valley on the 7th and continued through the 8th resulted in estimates of damages of 75 percent to the prune crop and something less than 50 percent to the grape crop. Nut crops and other fruits were also hit with a total loss in walnuts in many sections. Temperatures during this freeze in Napa County were from 1° to 2° higher than on March 25, 1936, but since fruits were generally advanced about two weeks compared to normal they were in the most vulnerable state. Frost damage was also reported in Santa Clara, Santa Cruz, and San Benito Counties. The greatest 24-hour precipitation which occurred on the 26th-27th at San Francisco, 2.36 inches, was the greatest 24-hour precipitation for April at that station since 1896. In the upper Sacramento Valley below-normal temperatures were unfavorable for growth of crops. During the last five days heavy rains occurred accompanied by severe thunderstorms on the 27th, 29th, and 30th. Grasses and grains received the greatest benefits from the precipitation. A few sheep which had just been sheared were reported killed by exposure to cold, driving rains during the severe thunderstorms. Above-normal temperatures in the Mt. Shasta district from the 18th to the 25th brought fruit trees in that locality into bloom while a killing frost on the 30th resulted in heavy losses to local fruit crops. In the lower Sacramento Valley the lack of adequate precipitation during the first 25 days was unfavorable for unirrigated crops. Heavy rains during the last five days accompanied by severe thunderstorms on the 27th, 29th, and 30th resulted in considerable damage to crops, particularly alfalfa, strawberries, and cherries. In the Kelsey-Garden Valley district in El Dorado County a hailstorm on the 29th resulted in virtually a total loss of the cherry crop, light losses in apples, and losses of from 50 percent to 100 percent in pears. In the Auburn, Bowman, Newcastle, Ophir, and Mt. Vernon districts of Placer County, hail, on the 29th marked pears, plums, cherries, and peaches. The maximum temperature of 84° on the 4th at Sacramento was the highest temperature ever recorded at that station for that date. The minimum temperature of 34° on the 8th was the lowest temperature ever recorded at Sacramento on that date. In the lower San Joaquin Valley the most notable feature of the weather was the extremely low temperature and killing frost in scattered districts on the 8th, 9th, and 11th. Killing frosts have occurred as late as April 14th at Fresno; however, the 32° minimum on the 9th established a new low temperature for such a late date in the season and also established the lowest temperature for the month of April at that station exceeding the former low of 34° of April 1908. The minimum temperature of 34° on the 11th also equaled the former record low temperature for the month of April at Fresno and established a new low temperature for the 11th. Damages to vineyards, potatoes, tomatoes, strawberries, squash, beans, figs, and other crops was very severe in some districts. Killing frosts on successive mornings on the 8th and 9th resulted in blackening of Thompson grape shoots in widely scattered districts with some extensive and concentrated damages reported in the Sanger River Bottom-Monmouth-Caruthers-Biola-Kerman districts and near Clovis. Tomatoes and squash were particularly hard-hit with damages up to 50 percent in the Reedly and Orange Cove districts and considerably higher in the Orosi district. Caprifigs were hardest hit in the Clovis district where individual estimates of damage ranged as high as 50 percent to 90 percent. Damage to terminal buds of Calimyrna figs was appreciable while Adriatic figs were damaged to the extent of about 10 percent in the Fig Garden district. A tornado in the Modesto district on the 27th demolished a 32-stanchion dairy barn, damaged other structures, and uprooted some trees north and west of Modesto. In the upper San Joaquin Valley frosts were reported severe but variable. A few potato fields were virtually wiped out, and others were hit in spots with some fields unaffected. Considerable damage occurred to grapes in some districts. The frosts on the 11th were the latest ever recorded in Kern County to date. The minimum temperature of 35° at Bakersfield on the 9th was the lowest temperature recorded for April at that station since 1929. In the Los Angeles area the lack of adequate rainfall during the first 26 days resulted in maturing of hay and maturing of grains while still very short with small heads. Below-freezing temperatures on the 8th and 9th resulted in severe damage to apricots, peaches, and some damage to walnuts in the Ojai district. In the San Diego area precipitation was too light to be of much benefit to crops. In San Pasqual Valley, Newcastle apricots were damaged by frost, and in the Julian district pears and early apples sustained severe damage as

a result of below-freezing temperatures. Cool weather in the Imperial Valley retarded development of crops.

MAY with an unweighted average temperature of 56.6° was the coolest since 1933 when an unweighted average temperature of 55.2° obtained, and the second coolest since 1897. The highest temperature for the State, 101°, recorded at Cow Creek in Death Valley on the 18th, and at El Centro in Imperial County on the 22d was the lowest maximum temperature for the State for May for the period 1897 to date. The former record-low extreme maximum temperature for May was 104° in 1911. Much-above normal precipitation occurred in some northern portions of the State. The 5.83 inches of precipitation for May at Eureka was the greatest amount for the month of May at that station since 1896 when 6.22 inches was observed. The greatest precipitation amount for May at Eureka was recorded as 7.20 inches in 1889. In the central coastal area cool weather with intermittent showers during the month was favorable for grasses but generally unfavorable for other crops, particularly fruits. Conditions were favorable for development of mildew in hops in Sonoma County and spreading of blight in cherries in Lake County. In Santa Clara County light rains contributed to some slight damage to cherries and strawberries. In Santa Cruz County some hail damage was reported to prunes in foothill districts. In the upper Sacramento Valley tomatoes and melons were affected adversely by cold weather and rains and in many instances were replanted. The average temperature at Red Bluff, 61.3°, was reported as the second lowest average on record at that station exceeded only by the average of 61.2° recorded in the vicinity of Red Bluff in 1896. At Mt. Shasta the average temperature, 47.0° was the lowest for the month of May since 1927 at that station when an average temperature of 46.0° was reported. The 4.7 inches of snowfall at Mt. Shasta established a new record for total monthly snowfall for May since records began in 1889 at that station. In the Lower Sacramento Valley cool, showery weather was beneficial for most grain and truck crops but favorable for development of mildew in grapes and hops. In the Garden Valley district of El Dorado County some damage to crops was reported as a result of hail on the 14th and 15th. The minimum temperature of 43° at Sacramento on the 24th was the lowest temperature ever recorded on that date at that station. In the Orland district a severe whirlwind wrecked a 120-foot shop building on the 19th. In the lower San Joaquin Valley continued much-below normal temperatures during the last two decades of the month were generally unfavorable for all crops. Rains accompanying the low temperatures favored the development of mildew and made mildew control difficult as rain washed sulphur from the leaves of dusted crops. Strong winds on some days prevented sulphur-dusting operations and other spraying operations. Also, temperatures were generally too low for satisfactory fuming of sulphur. At Fresno the average temperature for May, 61.7°, was the lowest on record at that station exceeding the previous record-low average temperature for May, 62.4°, established in 1917. The minimum temperatures of 41° on the 24th and 40° on the 26th established new low temperatures for those dates at Fresno, and the maximum temperature of 60° on the 15th equaled the previous low maximum for the month of May at that station. In the upper San Joaquin Valley well-below normal temperatures were generally unfavorable for crops. Cotton was reported at a virtual standstill, and grapes developed very slowly. At Bakersfield weather was the coolest for May since 1933. In the Santa Maria area weather was, for the most part, unfavorable for truck crops. Hot weather in the early portion of the month followed by moist conditions favored development of mildew. Rains contributed to considerable rot on strawberries with about one-half the crop reported lost. In the Los Angeles area temperatures during the last three weeks were generally too low for optimum growth of vegetation. In the San Diego area cool weather during the last three weeks retarded growth and maturing of fruits and other crops, particularly string beans and cucumbers. At San Diego the maximum temperatures on the 3d, 4th, 5th, and 6th exceeded all previous maximum temperatures on record for those dates with the 96° maximum on the 5th being the highest temperature recorded at that station since September 22, 1939 when 101° was observed. In the Imperial Valley weather was too cool for optimum growth of crops.

The unweighted average temperature for JUNE, 63.9°, was the third lowest average for June since 1923 when an unweighted average of 62.9° obtained, and also the fourth lowest for June since averages were first computed in 1897. In the central coastal area weather was generally too cool for optimum growth of crops. Rains in Sonoma County were unfavorable for many crops and contributed to cracking of cherries and development of very severe mildew in hops. In the Santa Clara Valley locally heavy showers on the 6th resulted in considerable damage to cherries. In the Santa Clara Valley apricots were about a month later than usual due to the cool weather during April, May, and June. Cherries, prunes, and other crops were also delayed as a result of the long, cool period. In the upper Sacramento Valley rains interrupted hay-baling operations and favored development of brown rot in peaches, prunes, and apricots. Much-below normal temperatures during the first half of the month contributed to making June one of the coolest on record. In the lower Sacramento Valley well-below normal temperatures during the first half of the month retarded development of most crops and favored mildew in fruits and field crops. In the lower San Joaquin Valley it was generally impossible to check the spread of mildew as a result of unusually cool and windy weather. Cotton was seriously retarded in Tulare County. Some cotton sustained root rot from much-below normal temperatures with verticullium wilt showing in places. The maximum temperatures of 60° and 74° at Fresno on the 1st and 6th respectively were the lowest maximum temperatures ever recorded on those dates at that station. The maximum temperature of 91° at Fresno on the 15th ended a period of 32 consecutive days with daily maximum temperatures below normal. This was the longest period of consecutive days with below-normal daily maximum temperatures in Fresno for the springtime since records began. In the upper San Joaquin Valley cool, cloudy weather during the first half of the month was, in the main, unfavorable for optimum growth of most crops, particularly cotton. In the Santa Maria area cool weather was favorable for the build-up of aphis and blight which resulted in considerable damage to walnuts. In the Los Angeles area weather during the first decade continued generally too cool for optimum growth of crops. In the Imperial Valley cool weather during the first week retarded the development of cantaloupes.

In JULY temperatures averaged generally well-above normal throughout the State; however, precipitation was well-below normal particularly in the north and central coastal area where very little rainfall occurred. In the north coastal area continued lack of precipitation resulted in increased fire danger in forests and ranges. High temperatures in the central coastal area were favorable for rapid ripening of fruits and berries but unfavorable in some instances for apricots, walnuts, and lettuce. In the upper Sacramento Valley warm, dry weather was beneficial for most crops and farming operations. Conditions were ideal for hay and grain harvesting as well as peach picking. In the lower Sacramento Valley above-normal temperatures and low relative humidities favored all backward crops which were retarded by the late spring cold and wet spell. High temperatures on the 21st contributed to some sunburn in walnuts. At Sacramento temperatures of 90° or higher were recorded on 28 days equaling the previous record for July at that station set in 1945. Clear skies every day with 100 percent of possible sunshine at Sacramento resulted in the third July in 50 years with 100 percent of possible sunshine at that station. In the lower San Joaquin Valley high temperatures favored rapid ripening of fruits, such as, peaches and apricots and, together with low relative humidities, favored fruit-drying operations. In the upper San Joaquin Valley warm weather resulted in considerable growth in cotton. Much-above normal temperatures in the Santa Maria area during the second week were unfavorable for pepper plants and lettuce. Considerable "tipburn" was reported in lettuce due largely to the hot weather. In the San Luis Obispo district high temperatures contributed to some sunburning of walnuts. In the Los Angeles area above-normal temperatures favored rapid development of grapes, beans, corn, tomatoes, and other crops. Rapid maturing of deciduous fruits resulted in some small losses due to forced handling. Hot weather on the 11th, 12th, and 13th contributed to sunburning of exposed walnuts and tomatoes. A relatively heavy drop of Valencia oranges was reported following the hot spell. In Los Angeles WB City the average temperature, 74.9°, was the second highest of record at that station.

AUGUST was the coolest since 1941 and the fourth coolest since 1897 and equal to 1925. Precipitation amounts in northern California were generally much-above normal with unprecedented amounts recorded at many stations. In southern California, however, precipitation amounts were generally well-below normal. The greatest monthly total precipitation in the State, 3.06 inches, was reported from Crescent City in Del Norte County. Crescent City also reported the greatest daily total, 2.06 inches, on the 26th. The monthly total of 3.06 inches at Crescent City and the daily total, 2.06 inches, exceeded all previous amounts on record for August for the 64-year period of record at that station. The previous greatest monthly total for August at Crescent City was 2.13 inches in 1943. The previous greatest daily total, 1.35 inches, was recorded on August 18, 1924 and August 2-3, 1947. In the central coastal area weather was too cool for optimum development of some crops. In the upper Sacramento Valley rains hampered alfalfa and prune harvesting but contributed to considerable reduction in fire danger in forests. The maximum temperature of 66° recorded at Red Bluff on the 29th was the lowest daily maximum temperature ever recorded for August at that station. The only measurable precipitation at Red Bluff during the month, 0.10 inch on the 29th, was the first measurable precipitation in 82 days at that station. A total of five heating degree days for the month also was the greatest degree-day accumulation on record at Red Bluff for August. In the lower Sacramento Valley cool weather was favorable for pastures but retarded maturity of pears to some extent. The cool spell during the last week terminated in a storm bringing the greatest precipitation of record, 0.67 inch, to Sacra-

mento WB City. The 0.67 inch of rain was not only the greatest amount ever recorded at Sacramento WB City for August but was more than the total of all rainfall at Sacramento WB City for all the months of August since 1849. The 103-year July total precipitation 1849-1952 was only 0.45 inch. In the lower San Joaquin Valley well-below normal temperatures were unfavorable for cotton, contributing to a slower rate of growth and development and some wilt. Cool weather together with high relative humidities contributed to some splitting and souring of figs. Well-below normal temperatures during the last week slowed development of cotton and maturation and sugaring of Thompson Seedless grapes. At Fresno, August was the coolest since 1900 and the third coolest on record. The average daily maximum temperature of 91.0° was the lowest recorded in August at that station since records began in 1888. The growing season during spring and summer was one of the coolest of record for this area. In the upper San Joaquin Valley well-below normal temperatures slowed development of cotton. At Bakersfield, August was the coolest since 1912. Foggy, cloudy weather in the Santa Maria area was somewhat unfavorable for crops. However, cool weather in the Los Angeles area was favorable for all crops and harvesting operations. In the San Diego area many crops manifested detrimental effects from rainfall deficiencies of the previous winter. Hay and grain crops produced only about one half the normal yield.

SEPTEMBER was characterized by much-above normal temperatures and much-below normal precipitation with the average precipitation over the State amounting to only 11 percent of normal, based on the weighted mean. September was the driest since 1937 and the third driest since 1897. In the central coastal area much-above normal temperatures during the second week favored rapid ripening of tomatoes, sugaring of grapes, and rapid development of other crops. In the upper Sacramento Valley much-above normal temperatures during the second week were very beneficial for prune-drying operations. At Red Bluff a maximum temperature of 109° occurring on the 10th, 13th, and 14th was reported as the highest for the year and also the highest for so late in the season at that station. Much-above normal temperatures in the lower Sacramento Valley were unfavorable for tomatoes with considerable sunscalding reported. High temperatures together with high relative humidities resulted in considerable mold in tomatoes and rejection of about 10 percent of the crop delivered to canneries. High temperatures also contributed to some sunburn damage in walnuts but favored development and maturing of rice. At Sacramento WB City the maximum temperature of 103° on the 13th was the highest temperature ever recorded for that date at that station. In the lower San Joaquin Valley well-below normal temperatures during the second week were favorable for maturing of figs; however, the fig crop sustained considerable spoilage by splitting and souring due largely to previous cool weather and high relative humidities. Grapes moved to wineries later than a year ago due to slowness in reaching acceptable sugar contents resulting largely from the cool weather in August. In the Los Angeles area high temperatures and low relative humidities during the second week were generally unfavorable for growing crops and farming operations. Irrigation water requirements for field crops, orchards, and pastures were heavy, and pest control operations were curtailed due to high temperatures.

In OCTOBER temperatures averaged generally near normal throughout the State; however, precipitation averaged below normal in northern California and well-below normal in southern California. Substantial rains in the north coastal area during the second and third weeks eliminated fire danger in forests and benefited grasses and other range feeds. Warm weather in the central coastal area during the first week was very favorable for maturing of apples and tomatoes and sugaring of grapes, but high temperatures contributed to considerable sunscald in tomatoes in the Salinas district. In the upper Sacramento Valley dry weather during the last decade was unfavorable for growth of grasses in winter pastures and prolonged irrigation. Dry, north winds in the lower Sacramento Valley from the 19th to the 22d were beneficial for some activities but detrimental to others. Conditions were favorable for drying of tomato vines thus decreasing mold and for lowering moisture content of rice and milo. Dry winds were unfavorable for windrowed fields of seed crops as considerable shattering obtained. Also, some harvesting operations were delayed, particularly in tomatoes. The fastest mile of wind 53 mph on the 21st with a gust to 55 mph was the strongest north wind of record at Sacramento. In the lower San Joaquin Valley warm, dry weather during the first decade was ideal for raisin drying with drying operations virtually completed. Strong winds on the 18th and 21st resulted in an estimated $300,000 loss to the lima bean crop on the west side of Stanislaus County. Fig harvesting was virtually completed with a short crop of lower quality than usual due to cool, humid weather in August and early September which contributed to slow drying and some splitting. The incidence of mold was reported higher than usual. Much-above normal temperatures in the Santa Maria area during the first week were detrimental to some crops. Tomatoes in the Santa Barbara district sustained some sunscald. Much-above normal temperatures in the Los Angeles area from the 3d to 8th curtailed pest control operations, stopped bean cutting, and increased irrigation water requirements. Considerable losses were reported in beans due to shattering. At Los Angeles WB City the average temperature of 69.1° resulted in the fifth warmest October in 76 years at that station. In the San Diego area much-above normal temperatures from the 3d to the 6th caused minor damage to tomatoes and some damage in both foliage and fruit on orange trees. At San Diego the average temperature, 67.4°, was the third highest on record for October at that station. The highest average for October, 68.1°, occurred in 1918.

In NOVEMBER temperatures averaged generally well-above normal throughout the State and precipitation ranged from much-above normal in the North Coast Drainage to much-below normal in the southeastern interior. Heavy rains from the evening of the 21st to the morning of the 23d over the extreme northwestern portion of California and southwestern portion of Oregon resulted in floods on the Smith River in California and on the Coquille River in Oregon. On the Smith River near Crescent City, the preliminary provisional peak discharge on the 24th was reported as 141,000 cfs. Recent peak discharges on the Smith River near Crescent City equal to or greater than the peak on the 24th were as follows: January 18, 1953: 141,000 cfs; October 29, 1950: 152,000 cfs. The latter peak discharge was the greatest at this station for the period of record, 1931 to date. Virtually all roads north and east of Crescent City were blocked by slides or washed out. Considerable losses were reported in livestock. At Elk Valley in Del Norte County, 8.12 inches of precipitation on the 22d was the greatest daily total for the 13 years of record at that station. The previous greatest daily total on record at Elk Valley was 7.16 inches for December 27-28, 1945. At Sacramento 10 days of fog equaled the greatest on record number of days with fog in November established in 1883. The percent of possible sunshine at Sacramento, 36 percent, was the least since 1905 when sunshine records began. At Fresno the precipitation on the 14th was very heavy for short periods. Thirty-five hundredths inch occurred in 30 minutes; 0.44 inch in one hour; and 0.64 inch in two hours. These were the greatest intensities on record for time periods indicated for the month of November at this station. At Los Angeles International Airport the maximum temperature of 90° on the 25th was the highest temperature ever recorded this late in the season at that station. Previous high temperatures recorded for this time of year were 83° on November 25, 1941 and 89° on December 3, 1940. The maximum temperature of 89° at San Diego on the 25th was the highest temperature ever recorded so late in the year at that station. Tomato harvesting continued in large volume to the end of the month with a number of good fields for December harvesting. Only slight damage resulted from rains, and quality was reported especially good for this time of year.

Temperatures in DECEMBER averaged above normal, but precipitation was much-below normal. This was the driest December since 1930 when the unweighted average precipitation was 0.47 inch and the second driest December on record since 1897 when average precipitation amounts were first computed. Snowfall was generally below normal but not the lightest on record. At San Francisco December was the driest since 1917. In the upper Sacramento Valley the lack of adequate precipitation had retarded growth of grasses and grains by the end of the month. At Mount Shasta December was the fifth warmest and also the fifth driest since 1888. At Red Bluff, December, with only five days with measurable precipitation totaling 0.46 inches, was the driest on record. The average daily maximum temperature at Red Bluff was the highest since 1938 at that station with maximum temperatures on the 16th, 25th, 26th, and 27th reported as the highest on record for those dates at Red Bluff. In the Los Angeles area a severe 'Santa Ana' northeast desert wind condition occurred on the 11th with wind speeds estimated at from 60 to 80 mph in the Fontana district. Many trees were forced down and structural damage was reported in the Fontana district. On the 27th and 28th strong, dry winds with speeds estimated at 100 mph whipped through Cajon Pass in a broad sweep coastward felling trees, power lines, and reducing visibility in sections of Riverside, San Bernardino, and Los Angeles Counties as dust clouds swept in. Blowing sand damaged many automobiles, and two major forest fires raced out of control before the strong, gusty winds of gale force in the San Gabriel Mountains, forcing the evacuation of hundreds of persons. A total of 4.08 inches of precipitation at Los Angeles WB City resulted in the driest calendar year of record at that station. The previous driest year was 1947 when a total of only 4.13 inches occurred. In the San Diego area continued dry weather was very favorable for prolonging the harvesting of the tomato crop. Tomatoes were very abundant and of good quality. The total annual rainfall at San Diego, 3.41 inches, resulted in the second driest year in 104 years of record at that station. In the driest year, 1863, San Diego received 3.02 inches of precipitation. The maximum temperature of 83° on the 14th equaled the highest temperature on record for that date at San Diego.

HHE

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

- No record.

+ Also later date (dates) or months.

* Amount included in following measurement.

// Gage is equipped with a windshield.

B Adjusted to full month.

C Data for recorder stations denoted by "C" are processed for special purposes and published in "Hourly Precipitation Data". Length of record for recorder-only stations may be found in the annual issue of "Hourly Precipitation Data".

E Amount is wholly or partially estimated.

M Less than a complete month of record available; if average value is entered, less than 10 days of record are missing. See monthly Climatological Data for detailed daily record.

R Data from recording gage.

T Trace, an amount too small to measure.

V Includes total for previous months. V in annual column means total is for a two-year period.

S Storage precipitation station. Data will be published in the July or August or delayed data December issue of Climatological Data.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to Superintendent of Documents, Government Printing Office, Washington 25, D. C.

JANUARY 1954

Volume LVIII No. 1

CHATTANOOGA: 1954

CALIFORNIA - JANUARY 1954

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 316 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 44.9° or 1.1° above the weighted mean. The unweighted average based on the same 316 stations was 45.3° or 1.0° above the unweighted mean. The highest temperature, 92°, was recorded at El Cajon Yale Ranch on the 5th. The lowest temperature, -11°, occurred at Mount Hebron R. S. on the 25th.

The average precipitation for the State based on 323 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 5.60 inches or 1.62 inches above the weighted mean. The unweighted average based on the same 323 stations was 6.00 inches or 1.60 inches above the unweighted mean. Based on 552 stations listed in Table 3, the unweighted average was 6.57 inches or 2.17 inches above the unweighted mean. The greatest monthly total precipitation, 31.58 inches, was reported from Upper Mattole at an elevation of 400 feet above mean sea level in Humboldt County. The greatest daily precipitation amount, 9.69 inches, was recorded on the 17th at Hoberg's at an elevation of 2980 feet in Lake County. The least monthly total precipitation, 0.19 inch, was recorded at Calexico at an elevation of 3 feet above mean sea level in Imperial County.

A storm period during the middle portion of the month which brought heavy precipitation to almost all areas of the State also brought nearly the entire snowpack in the Sierra Nevada. The snowpack was considerably less than a year ago ranging from over 100 percent of normal in the Cascade Mountain region to less than about 40 percent of normal in the southern Sierra Nevada area. The greatest monthly total snowfall, 89.0 inches, was reported from Soda Springs at an elevation of 6752 feet in Nevada County. Ten other stations reported a monthly total snowfall of 60.0 inches or more.

Heavy rains in the north coastal area during the periods, 15th to 17th and 26th to 28th, brought sharp rises in all streams and rivers. A stage of 23 feet was reported on the Eel River at Fernbridge on the 17th. This stage was exceeded in the past in only one or two instances. Considerable low, bottom lands were flooded and littered with debris; and serious erosion occurred to stream banks, roads, and other facilities.

Rains in the central coastal area were of great benefit to pastures, ranges, and grains. At San Francisco the seasonal precipitation for the period July 1, 1953 to January 7, 1954 was 3.39 inches. This was the driest season up to January 7th since 1918 when a total of only 1.55 inches was recorded, and the sixth driest for the same period since records began in 1849 at San Francisco. Other drier seasons up to this date were: 1851, 2.90 inches; 1879, 2.98 inches; 1906, 2.97 inches; 1911, 2.91 inches. Heavy rains in the Russian River basin on the 16th resulted in considerable flooding along the Russian River from Ukiah to Guerneville. Small bridges were washed out; some homes were flooded; and miscellaneous equipment was damaged as a result of flood waters. In Monterey County generous rains were favorable for pasture lands but unfavorable for planting and cultivating of vegetable crops.

Comparatively dry weather in the upper Sacramento Valley during the first half of the month was beneficial for pruning, planting, grain fertilizing, and strawberry plant harvesting; however, the lack of precipitation retarded growth of grasses and grains. At Red Bluff the total seasonal precipitation to January 10, 1954 was 4.69 inches. This was the driest season up to January 10th since 1949 when only 3.67 inches accumulated and the eighth driest period up to January 10th since records began at that station in 1872. Rains during the last half of the month alleviated drought conditions which were developing. Moisture made plowing and cultivating of soils practicable; and stock water supplies, which had diminished to critical levels, were replenished. Heavy rains on the 17th brought creeks up to points not reached in many years. Rains were beneficial for grains, grasses, and other growing crops. Strong winds, low temperatures, and moisture freezing on lambs killed many lambs as old as three weeks. At Red Bluff only 756 hours with temperatures below 45° were recorded from September 1, 1953 to January 23, 1954 which was considered a poor season for winter chilling and unfavorable for high yields in fruit crops. At Red Bluff strong winds occurred on several days with the average hourly speed reported as 11.7 miles per hour for the month. This average hourly speed equaled the average hourly speed for February 1878 and was surpassed only by the average of 11.8 mph which occurred in March 1953. The fastest mile, 50 mph from the SE, occurred during the storm of the 17th.

Strong, dry, northerly winds in the lower Sacrament Valley on some days during the first half of the month con tributed to considerable drying of topsoils. By the 15t dry weather had somewhat retarded all growing crops; parti cularly barley, wheat, and oats. Ranges and pastures wer at a virtual standstill, and some irrigation was starte in truck crops. Heavy rains on the 16th and 17th benefite all growing crops and resulted in considerable improvemen in grains and grasses. The fastest mile of wind, from th SE at 60 mph with gusts to 70 mph, accompanied the storm o the 17th in the Sacramento area.

The generous rainfall in the lower San Joaquin Valley o the 24th was very favorable for grasses as pastures wer approaching a critical stage with respect to soil moisture and newly-seeded crops were in great need of moisture fo germination and growth.

In the upper San Joaquin Valley soil moisture condition during the first half of the month were not critical, bu more precipitation was needed. Rains from the 17th to 25t were very beneficial for all growing crops. Most of th moisture was absorbed by the dry soils with very littl runoff.

In the Santa Maria area a serious drought continue through the first 10 days of the month causing great con cern for all crops. Irrigation was used freely in an effor to save vegetation. Pastures and ranges were at a very lo level. Precipitation from the 11th to 25th, in near-nor mal amounts for the month, saved practically all crops fro failure. Pastures improved almost immediately.

Drought conditions continued in the Los Angeles are during the first decade with some total losses reported i grains. Pastures were supplying no feed for cattle an were in great need of more precipitation. Orchards wer being maintained by irrigation, and normal tree and frui growth was retarded by lack of general winter rains. A Los Angeles the total seasonal precipitation to January 11 1954 was 1.19 inches. This was the driest season up t January 11th at Los Angeles since 1918 when only 0.43 inc had accumulated and the second driest on record for tha period. Rains on the 11th and 12th were beneficial for al crops. The slow rate of fall permitted maximum soil pene tration. More precipitation was needed for orchards, an irrigation was still necessary on reduced schedules. Heav rains beginning late on the 17th brought an end to th drought conditions with storm totals from two to four inche in coastal areas and up to eight to ten inches in mountai districts. Precipitation was very beneficial for all grow ing crops and dormant vegetation. Irrigation was halte in all districts, and some water accumulated in storag reservoirs. Several periods of moderate to heavy rains i burned-over watershed districts of the San Gabriel Moun tains resulted in flash floods with water carrying mud rocks, and debris from canyons causing considerable damag to homes, yards, streets, and automobiles in foothill citie of Sierra Madre and Monrovia. In Limekiln Creek, Big Tu junga Creek, and Arroyo Seco, tributaries to the Los Angele River, flood conditions were as follows: Limekiln Cree overflowed its banks and caused damage to streets and lawn in Reseda. Damage in Big Tujunga and Arroyo Seco consiste of an accumulation of debris in dams and spreading ground which required removal. On the lower Los Angeles Rive damages were sustained to equipment and construction wor on a bridge. Total losses were estimated at $7,500 on th Los Angeles River. Foothill tributaries of the Rio Hondo including Bailey, Floral, Auburn, and Carter Washes i Sierra Madre; an unnamed tributary of Santa Anita Wash i Arcadia; Sawpit Wash in Monrovia; and Rubie Wash brough flood waters, mud, and debris down steep mountain slope recently denuded of growth by forest fires, into creek beds and out onto highly developed residential areas. Debri basins in streams were filled, and mud and boulders wer washed into streets and homes. Large boulders ranging u to four feet in diameter were carried by the streams. De posits of mud and debris ranged up to six feet in depth Two hundred families were forced to evacuate their homes Total losses estimated for the Rio Hondo and tributarie was $438,000. Tributaries of the San Gabriel River, in cluding Bradbury and Maddock Washes which lead into th Duarte area, Palmer Canyon and Thompson Creek brought de bris from the watershed area denuded in 1952 and 1953 b forest fires and deposited it on residential and highwa properties. In Palmer Canyon mud and debris flow, togethe with heavy boulders, caused damage to homes. About 75 per cent of the homes in the canyon were damaged, and six home

AVERAGES FOR THE PERIOD OCTOBER 1948 TO DATE HAVE BEEN WEIGHTED ACCORDING TO AREA AND ARE NOT COMPARABLE WITH UNWEIGHTED VALUES PUBLISHED IN THIS TABLE FOR EARLIER YEARS.

WEATHER SUMMARY (Continued)

were completely destroyed. All residents of Palmer Canyon were forced to evacuate and were unable to return until after the second flood on the 24th had subsided. Considerable losses were also sustained by roads and utilities, and flood control and debris basins and spreading grounds were partially filled with mud and debris. Losses to public and private property on the San Gabriel River were estimated at $323,700. On San Antonio and Chino Creeks, tributaries to the Santa Anita River, 16 highway and road crossings were either washed out or damaged, and the San Antonio Creek Spreading Grounds of the Los Angeles County Flood Control District received debris which had to be removed. Other inconveniences occurred when motorists were required to detour to crossings that were passable. Total losses on the Santa Anita River were estimated at $41,500.

The lack of adequate precipitation in the San Diego area during the first decade resulted in serious drought conditions. Feed on ranges was reported scarce. Grains failed to germinate, and planting of many crops was delayed pending adequate soil moisture. In many districts lemons were reported smaller and of somewhat lower quality than normal. At San Diego the total seasonal precipitation up to January 11th was 0.90 inch. This was the driest season up to January 11th since 1903-04 when only 0.24 inch had accumulated. Four other seasons up to January 11th recorded less than 0.90 inch of precipitation. Generous rains during the period from the 11th through the 25th were extremely beneficial for crops and resulted in the end of severe drought conditions. At San Diego 2.76 inches of precipitation for the month was 1.07 inches above normal for January. This was the first month at San Diego since November 1952 in which the total precipitation exceeded the monthly normal amount.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state oasis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Data in the column formerly headed "No. of Days .01 or more" in Table 2, have been changed to "No. of Days .10 or more" effective January 1, 1954.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10 30 a.m., PST and Blue Canyon WB AP 6 00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price 15 cents per copy, monthly and annual: $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1954

CALIFORNIA - FEBRUARY 1954

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 314 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 51.2° or 4.1° above the weighted mean. This was the warmest February since 1924 and the fourth warmest since 1897. The unweighted average temperature, 51.2° or 4.0° above the unweighted mean, was exceeded only by February averages of 52.0° in 1906, 53.3° in 1907, and 53.3° in 1924. At many stations the average temperature was the highest on record. The highest temperature, 98°, occurred at Mecca on the 24th. This was the highest temperature for the State for February since 1907 when the highest was 98° at Craftonville in San Bernardino County. Other extremes of 98° or more were recorded as 100° in 1899 at Upper Tres Pinos in San Benito County, 98° in 1901, and 105° in 1902 at Palm Springs in Riverside County. The lowest temperature, -11°, occurred at Soda Springs at an elevation of 6752 feet in Nevada County on the 15th.

The average precipitation for the State based on 319 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 2.96 inches or 1.06 inches below the weighted mean. The unweighted average based on the same 319 stations was 3.29 inches or 1.25 inches below the unweighted mean. Based on 555 stations listed in Table 3 the unweighted average precipitation was 3.54 inches or 1.00 inches below the unweighted mean. The greatest monthly total precipitation, 13.75 inches, occurred at Strawberry Valley in Yuba County in the Sierra Nevada. The greatest daily total precipitation, 6.35 inches, was recorded on the 12th at Lakeshore in Shasta County in northern California. In the southeastern interior five stations reported no precipitation, and seven stations recorded only a trace.

The greatest total snowfall reported in the State, 78.0 inches, occurred at Soda Springs at an elevation of 6752 feet in Nevada County. Five other stations reported a total of 50.0 inches or more for the month: Blue Canyon WB AP, 52.9 inches; Twin Lakes, 72.5 inches; Huntington Lake, 53.0 inches; Cisco RS, 61.0 inches; and Sagehen Creek 62.0 inches.

The lack of precipitation in the north coastal area during the first decade permitted soils to dry somewhat and resulted in considerable activity in fields. Heavy precipitation on the 12th resulted in a rapid rise of the Eel River to near flood stages.

Grains and grasses in the central coastal area made satisfactory growth during the first decade but were in need of more precipitation by the end of the period. Rains during the second decade were very beneficial for all growing crops, and by the end of the period soils were generally too wet for field operations, particularly in northern districts. Much-above normal temperatures during the last week were favorable for grains and grasses, and in the Santa Clara Valley apricot blossoms opened rapidly, and late almond varieties were in full bloom. At Mount Hamilton the average temperature of 50.7° or 10.1° above the long-period mean was the highest average temperature on record at that station for February since 1897. The previous greatest average for February was 48.2° in 1907. The average daily maximum and average daily minimum temperatures at Mount Hamilton also exceeded any previous average on record for February at that station.

Warm weather in the upper Sacramento Valley was beneficial for lambing but unfavorable for almonds by contributing to early blossoming. Rains during the second decade were very favorable for grains, grasses, and filling of water holes and reservoirs. Field operations, however, were curtailed as a result of wet, windy weather and muddy soils. Much-above normal temperatures during the last week brought almonds into full bloom. At Mt. Shasta, February was the third warmest since 1908. At Red Bluff no below-freezing temperatures occurred during the month. Fog during the first 11 days established a record at Red Bluff; a total of only 25 days with heavy fog were recorded during the previous 64 years of record. Hail occurred on the 17th, but no damage was reported.

Cool weather in the lower Sacramento Valley together with the lack of adequate sunshine during the first half of the month slowed development of crops. At Sacramento a total of 13 days with heavy fog was observed as the greatest number of days with heavy fog in February at Sacramento in 76 years. The previous record number of days with heavy fog at Sacramento for February, 12 days, occurred in 1947. Cool weather contributed to holding back development of buds on almond and peach trees. Rains during the second decade were very beneficial for all truck crops and grains. Much-above normal temperatures during the last week were favorable for all farm work. Grains made rapid progress, and fruit and nut trees blossomed about two weeks earlier than usual. This was reported as a rare season with weather permitting planting of considerable acreages of sugar beets without any significant interruptions. The maximum temperature of 72° at Sacramento on the 23d exceeded the previous highest temperature on record for that date. On the 25th the 74° maximum temperature equaled the previous highest temperature for that date at that station. At Blue Canyon WB AP the 73° maximum temperature on the 8th was the highest temperature ever recorded for the month of February at that station. The average temperature of 46.6° at Blue Canyon WB AP was the highest average for February since 1907 when an average of 48.4° obtained.

Despite the lack of precipitation in the lower San Joaquin Valley during the first decade, weather was, in general, beneficial for most crops. High relative humidities and absence of frosts were favorable for cover crops and range grasses. The principal feature of the weather was the persistence of fog and lack of sunshine. Rains during the second decade hampered field work to a large extent; however, alfalfa, grains, and grasses benefited considerably from the added moisture. Above-normal temperatures during the last week accelerated blossoming and swelling of buds on fruit and nut trees. In Fresno County almonds were blooming, and buds were swelling on early peaches and plums.

Fog together with some drizzle in the upper San Joaquin Valley during the first decade was helpful in maintaining moisture in soils and giving ranchers an apportunity to prepare soils for planting. By the end of the month almond trees were in full bloom, and early plums were starting to blossom. Ranges in foothill and mountain areas looked good but were in need of more precipitation.

Much-above normal temperatures in the Santa Maria area were favorable for development of some crops but forced broccoli and cauliflower and contributed to some flowering in broccoli. Rains during the second decade were very beneficial for all crops. Much-above normal temperatures during the last week brought cauliflower along faster than was desirable and resulted in some sunburn damage in cauliflower. At Santa Maria the previous high temperature records for individual days were exceeded on 15 days of the month, as determined from the past 12 years of record at the Weather Bureau Office. The average temperature for February, 56.9°, was the highest at Santa Maria since 1918 with the exception of 1926 when the February average temperature was 57.1°.

Much-above normal temperatures in the Los Angeles area during the first week contributed to rapid drying of soils. Grains, grasses, and cover crops made rapid growth, but pest-control operations were curtailed by the much-above normal temperatures. Generous rains on the 13th were of considerable benefit to all crops, particularly field crops, orchards, pastures, and ranges. Heavy downpours in some places resulted in considerable runoff with some flood damage reported in low-lying sections of the coastal plain in Los Angeles County from Santa Monica to Long Beach. Reports indicated that storm totals ranged from two to four inches on the coastal plain to near six inches over nearby mountain areas. Damages were largely due to runoff from streets caused by excessive rainfall. Local storm drains were unable to carry the runoff and many streets and street intersections were flooded with water rising to depths sufficient to inundate cars and the first floor of homes and business establishments in some districts. Total property damage was estimated at $170,000. Much-above normal temperatures during the last decade accelerated growth of all vegetation. Deciduous trees bloomed profusely, and ornamentals were leafing. Topsoil moisture, however, decreased rapidly as a result of the high temperatures and low relative humidities. At Burbank WB AP the maximum temperature of 91° on the 23d was the highest temperature on record for the month of February at that station. Also the average of 62.0° at Burbank WB AP was 4.2° higher than any previous February average on record at that station. At Pomona, San Fernando, and other stations in the Los Angeles area the average temperature for February was the highest on record.

Rains in the San Diego area on the 13th and 14th were beneficial for all crops. Above-normal temperatures during the last week were favorable for growth of all vegetation and contributed to early blossoming of fruit trees. With an average of 61.2°, February was the warmest on record at San Diego WB AP for the period beginning 1872. The previous highest February average temperature, 60.1°, was recorded in 1907. Maximum temperatures on seven days exceeded previous highest temperatures of record for those days, respectively, at that station. The maximum temperature of 88° on the 7th was only 1° lower than the highest temperature ever recorded in February at San Diego WB AP.
